MORE ORDERS

SHOPIFY PRODUCT PAGE UPGRADE

The four things I added to my own product page (mahekh.in) to get more orders, and the exact prompts to add them to your store with Claude Code, Antigravity or Codex.

WHAT YOU NEED

- 👉 Your **Shopify store admin** (owner or a staff login with theme access).
- 👉 An AI that can work on a folder of code: **Claude Code**, **Antigravity** or **Codex**.
- 👉 Optional, for a live preview: Shopify CLI.
- 👉 **Good to know:** Claude's one-click Shopify connector can read your store, but it **can't edit your live theme**. Product page changes happen in your theme code, which is why you open the theme folder in your AI.

STEP 1: CONNECT YOUR THEME TO YOUR AI (SAFELY)

- 👉 Shopify admin → **Online Store** → **Themes** → the **...** menu on your live theme → **Duplicate**. This copy is your backup. Never edit the live theme directly.
- 👉 Get the code of the copy: **...** → **Download theme file** (Shopify emails you a .zip, unzip it), or with Shopify CLI run `shopify theme pull` and pick the copy.
- 👉 Open that folder as the project in **Claude Code**, **Antigravity** or **Codex**, then paste the prompts below one at a time.
- 👉 Live preview while the AI works: run `shopify theme dev` inside the folder and open the preview link on your phone.

UPGRADE 1: ESTIMATED DELIVERY DATE

👉 Shows the buyer **when it will arrive** before they buy, plus a pincode check and a dispatch countdown. On my page: *"Delivery available to [pincode] by Sat, 7 Nov"*.

👉

```
You are editing my Shopify theme. On the product page, right under the price, add an "Estimated delivery" block:
- Show a date range: today plus three to five working days, skip Sundays, written like "Sat, Nov 7".
- Add a pincode checker: a six-digit input and a CHECK button. Check the pincode against a list of serviceable pincodes I will give you (keep the list in a theme setting or a JSON asset). Show "Delivery available to [pincode] by [date]" in green, or "Sorry, we don't deliver here yet" in red.
- Add a line under it: "Order within [hours]h [minutes]m to dispatch tomorrow", counting down to my daily dispatch cutoff time (a theme setting).
- Make it a block I can move or switch off in the theme editor. Mobile first. Don't change any other section.
```

👉 Use your **real** courier times and serviceable pincodes. A wrong promise brings returns.

UPGRADE 2: SHORT PREMIUM DESCRIPTION (HTML + CSS)

👉 Replace a plain wall of text with a short, designed story: a dark hero card, what's inside, how to use it.

👉

```
Write a short premium product description for [product name] as HTML + CSS for my Shopify product page.
- Parts: a dark hero card with a two-line headline and one short paragraph, an "Inside the pack" panel, and a "How to use" panel.
- Scope all CSS under one class (for example .pd-premium) so it can't break my theme. No external fonts or scripts.
- Mobile first, easy to read on small screens, in my brand colours: [colours].
- Build it as a new section (sections/premium-description.liquid) whose text comes from section settings, and add it to the product template under the main product info.
```

👉 Keep it short: the buyer should get the feel of the product in a few seconds of scrolling.

▪ UPGRADE 3: STICKY BUY NOW BUTTON

👉 A bar with the product, price and **Buy Now** that stays on screen while the buyer scrolls, so buying is always one tap away.

👉

```
Add a sticky Buy Now bar to the product page on mobile:
- Fixed to the bottom of the screen with the product image, a short title, the current price and a Buy Now button.
- Show it only after the main Add to cart / Buy Now buttons scroll out of view, and hide it again when they are back on screen.
- Buy Now must use the variant and quantity selected in the main product form and go straight to checkout. Update the price when the variant changes.
- Respect the iPhone safe area, don't cover my WhatsApp or chat buttons, and hide it on desktop.
- Build it as a snippet included in the main product section, with an on/off theme setting.
```

▪ UPGRADE 4: SALES NOTIFICATIONS (REAL ORDERS ONLY)

👉 Small pop-ups like *"Someone in Lucknow just bought this"* show that real people are buying. That proof creates urgency in the buyer's mind.

👉

```
Add sales notifications to my product page using only real orders:
- A small pop-up at the bottom left: product image, "Someone in [city] just bought [product]" and how long ago.
- The data must come from real recent orders (a sales-pop app or a feed I control). If there are no recent orders, show nothing. Never invent names, cities or numbers.
- One pop-up at a time, a few seconds each, with a close button, and never on top of the sticky Buy Now bar.
```

👉 Easiest route: a **sales-pop app from the Shopify App Store** that reads your real orders.

👉 **Never fake it.** Made-up "just bought" pop-ups or fake countdowns count as **false urgency** under India's dark-pattern guidelines (Central Consumer Protection Authority), and buyers stop trusting you.

▪ STEP 2: PREVIEW, THEN PUBLISH

👉 Check the page on your phone: the delivery check, the description, the sticky bar while you scroll, and the pop-ups.

👉 With Shopify CLI: `shopify theme push --unpublished` uploads the work as a new draft theme. Or zip the folder and use **Online Store → Themes → Add theme → Upload zip file**.

👉 Open **Preview**, test one real checkout, then **Publish**. Your old theme stays in the list as a backup.

ACTION CHECKLIST

- ✓ Backup copy of the live theme made first
- ✓ Estimated delivery date + pincode check under the price
- ✓ Short premium HTML/CSS description
- ✓ Sticky Buy Now bar on mobile
- ✓ Sales notifications from real orders only
- ✓ Tested on a phone before publishing

KEY TAKEAWAY

Your product page is your salesman: show when it arrives, tell the story in a premium way, keep Buy Now one tap away, and show real proof that others are buying.
